LIFE18 NAT/IT/000164

1. GENERAL AIMS OF THE ACTION

In this action of the project, we are intended to genetically characterize a total of 2064 young individuals of *Abies nebrodensis* from the local nursery Piano Noce. These plants represent the first selection step of plants to be used for reforestation, thus it is important to disentangle their genetic origin to differentiate pure *A. nebrodensis* seedlings from putative hybrids with other alien fir species.

2. METHODS

Following the same procedure described for the action A.1.1, we extracted the DNA and then used SNPs genotyping through PCR-based OpenArrays technology to get the genotypes of all sampled seedlings. Then, paternity tests using the COLONY software v.2.0.6.6 were carried out on the seedling genotypes to determine the outcrossing (cross between unrelated individuals), inbreeding and self-fertilization and to assess the rate of introgression (eventual hybridization) due to fertilization of female cones with pollen coming from alien firs (namely, *Abies alba* and *A. cephalonica*).

3. MAIN RESULTS

3.1. Genetic purity of *Abies nebrodensis* seedlings

We used 100 highly informative SNPs to genetically characterize a total of 1776 of the 2064 seedlings (86.05%; Table 5) that were sampled from the nursery. We could not obtain the genotypes for the remaining 288 young individuals due to the low DNA purity and/or concentrations during the extractions of these individuals. Of the 1776 genotyped seedlings, 1525 individuals (85.87%) were assigned to one or more compatible candidate parents with very strong support (probability of correct assignment = 100%). We inferred the origin (considering as such the identification of one or both parents) of 1242 seedlings: most of them (897) were found to be both parents assigned to some of the genotypes of *A. nebrodensis* adult-trees (i.e. both parents were *A. nebrodensis* plants; for the remaining 345 seedlings, only one of the parents were assigned to an *A. nebrodensis* genotype (i.e. they are putative hybrids with other fir species) (Fig. 6). Additionally, the analyses

LIFE18 NAT/IT/000164

suggested that 283 seedlings have unknown parents which were not related to *A. nebrodensis* (i.e. both parents are other *Abies* species) (Fig. 6). In this way, we estimated the presence of up to 17 different unknown genotypes different from those of the 30 adult-trees of *A. nebrodensis*, which suggest that hybridization with alien firs is common in plants from the nursery. Finally, we could not infer the parental origin with an acceptable level of confidence (mean probability of correct assignment < 50%) for 251 of the 1776 seedlings (Table 5). For these seedlings, the paternity analysis frequently assigned at least one of the parents to a different alien fir genotype. Details of results of paternity tests and the probability of correct assignments (considering as such two different thresholds: 100% and higher than 90%) are specified in Table 6.

Table 5. Results of the genetic characterization of the 2064 young individuals of *Abies nebrodensis* sampled in the local nursery Piano Noce.

1. Seedlings genetically characterized:	1776 (86.05% of total seedlings)
a) Seedlings whose parental origin was confidentially inferred:	1525
a.1) Both parents are <i>A. nebrodensis</i> adult-trees:	897
a.2) One of the parentals is <i>A. nebrodensis</i> , but the other one is unknown (i.e. another <i>Abies</i> species):	345
a.3) Both parents are unknown (i.e. another <i>Abies</i> species):	283
b) Seedlings whose parental origin could not be confidentially inferred:	251
2. Seedlings that could not be genetically characterized:	288 (13.95% of total seedlings)

Seedlings whose parental origin was confidentially inferred ($n = 1525$)

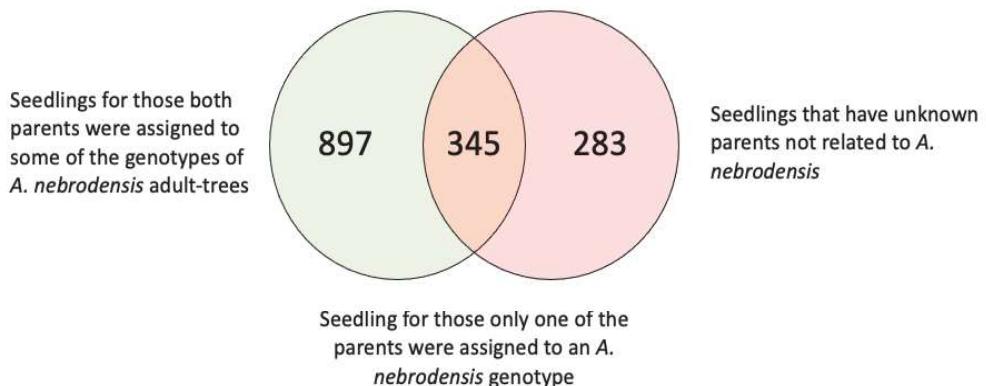

Fig. 6. Venn diagram showing the number of seedlings for those both parents, one or none of them were assigned to some of the genotypes of *A. nebrodensis* adult-trees with 100% of confidentiality.

3.2. Genetic diversity of pure *Abies nebrodensis* Seedlings growing at the nursery

Most of the pure *Abies nebrodensis* seedlings were originated by selfing (Table 7). We assessed the inbreeding level of the analyzed seedlings ($n = 1776$) by estimating their inbreeding coefficient (F_{is}). As expected, we obtained very similar values to those obtained for the natural population. Thus, $F_{is} = 0.354$ when inbreeding was accounted in the analysis, obtaining a higher value ($F_{is} = 0.523$) when selfing was considered in the analysis; in any case, these F_{is} values point to a remarkable level of inbreeding for *A. nebrodensis* individuals. Moreover, we estimated the effective population size (N_e), which is a key parameter in population genetics that estimate the number of individuals that effectively contributes offspring to the next generation. We found that $N_e = 12$ (6 – 26; Confidence Interval 95%) for the *A. nebrodensis* population, reflecting the strong impact of genetic drift and inbreeding on the evolutionary dynamics of this population.

The genetic origin of each *A. nebrodensis* seedling from the nursery is detailed in Tables 6 and 7.

LIFE18 NAT/IT/000164

Table 6. List of the 1776 seedlings of *A. nebrodensis* sampled from the nursery Piano Noce with their inferred progenitors as a result of paternity tests and the probability of correct assignment (considering as such two different thresholds: 100% and higher than 90%). The symbol "#" indicates those cases where the genotypes of the inferred father and/or mother were different from those of *A. nebrodensis* adult-trees. Note that one seedling may appear in two or more rows because of the low probability of correct assignment.

Offspring ID	Inferred Dad	Inferred Mum	Probability (%)	Pure <i>A.nebrodensis</i> (threshold = 100%)	Pure <i>A.nebrodensis</i> (threshold >90%)

Table 7. Proportion of pure *Abies nebrodensis* seedlings growing at the nursery Piano Noce coming from selfing or outcrossing.

Type of seedling	Proportion
Seedlings originated by selfing	878 out of 897 (97.9%)
Seedlings originated by outcrossing of two <i>A nebrodensis</i>	19 out of 897 (2.1%)
